A Gas Expansion Thermometer is a temperature measuring instrument that relies on the principle of thermal expansion of a gas. As the temperature increases, the volume of the gas expands, and this expansion is directly related to the temperature change. This expansion is typically converted into a measurable signal, such as a pressure change, which is then used to determine the temperature. Gas expansion thermometers include types like bourdon tubes, thermosiphons, and gas-filled thermistors. They are known for their accuracy and stability and are used in various industries, including HVAC, power generation, and chemical processing, where precise temperature control is essential.

The global Gas Expansion Thermometer market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
