## Abstracts

According to this study, the global Gas-fired Combined Cooling Heating and Power System market size will reach US\$ 224 million by 2031.

A gas-fired Combined Cooling, Heating, and Power (CCHP) system, also known as trigeneration, is an energy-efficient system that simultaneously produces electricity, heating, and cooling from a single fuel source—typically natural gas. At its core, a gas turbine or engine generates electricity, and the waste heat from this process is captured to provide heating (e.g., hot water or steam). This thermal energy can also be used in absorption chillers to produce cooling for air conditioning. By utilizing the waste heat that would otherwise be lost in conventional power generation, CCHP systems significantly improve overall energy efficiency, reduce fuel consumption, and lower greenhouse gas emissions, making them ideal for commercial buildings, hospitals, campuses, and industrial facilities with continuous thermal and electrical loads.

United States market for Gas-fired Combined Cooling Heating and Power System is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
