Gas monitoring in mines refers to the process of continuously measuring and detecting the presence of harmful gases within underground mining environments to ensure the safety and health of workers. Common gases monitored include methane (CH?), carbon monoxide (CO), hydrogen sulfide (H?S), and oxygen (O?). These gases can pose serious risks, such as explosions, poisoning, or asphyxiation. Advanced gas detection systems, often equipped with sensors and alarms, are installed to provide real-time data and early warnings, enabling prompt action to mitigate hazards. Effective gas monitoring is critical for maintaining safe working conditions, adhering to regulatory standards, and preventing accidents in mining operations.
