Gas particulate filter tank is a tank device filled with activated carbon and other filling materials, which have chemical and physical adsorption and filtration capabilities, and can remove dust, toxic and harmful substances in the air, the air filtered by the canister is for people to breathe. This kind of device can be large or small, and can be determined according to the requirements of the connecting parts and devices, the amount of dust and toxic substances in the air, the size of the air space required for poison filtering, and the service life and replacement life of the poison filtering equipment. . As the canister installed under the gas mask is just very small, it is a tank body with certain specifications that can be matched with the gas mask. The canister

installed on the air ventilation poison filter device is larger, and can be designed according to specific requirements or selected according to the specifications of existing products. The poison filtering substance filled in the canister needs to be replaced regularly, and its variety is determined according to factors such as the type and content of dust and toxic substances, and the time of regular replacement.
