The report requires updating with new data and is sent in 48 hours after order is placed.

Gaseous Tritium Light Source (GTLS) is the use of gaseous tritium, a radioactive isotope of hydrogen, to create visible light. Tritium emits electrons through beta decay and, when they interact with a phosphor material, light is emitted through the process of phosphorescence. The overall process of using a radioactive material to excite a phosphor and ultimately generate light is called radioluminescence. Tritium lighting is made using glass tubes with a phosphor layer in them and tritium gas inside the tube.
