The global Gastric Motility Drugs market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Gastric motility drugs, also known as prokinetic drugs, are drugs that promote the forward movement of gastrointestinal contents. When gastric motility is low, the emptying of gastric contents is delayed, which can cause many gastrointestinal diseases, such as nausea, vomiting, heartburn, postprandial discomfort, dyspepsia, etc., and can cause gastroesophageal reflux, leading to esophageal ulcer. Gastric motility drugs are used clinically to treat related diseases, such as reflux symptoms, reflux esophagitis, dyspepsia, intestinal obstruction and other common diseases.

The global pharmaceutical market is 1475 billion USD in 2022, growing at a CAGR of 5% during the next six years. The pharmaceutical market includes chemical drugs and biological drugs. For biologics is expected to 381 billion USD in 2022. In comparison, the chemical drug market is estimated to increase from 1005 billion in 2018 to 1094 billion U.S. dollars in 2022. The pharmaceutical market factors such as increasing demand for healthcare, technological advancements, and the rising prevalence of chronic diseases, increase in funding from private & government organizations for development of pharmaceutical manufacturing segments and rise in R&D activities for drugs. However, the industry also faces challenges such as stringent regulations, high costs of research and development, and patent expirations. Companies need to continuously innovate and adapt to these challenges to stay competitive in the market and ensure their products reach patients in need. Additionally, the COVID-19 pandemic has highlighted the importance of vaccine development and supply chain management, further emphasizing the need for pharmaceutical companies to be agile and responsive to emerging public health needs.
