A Gear Flow Meter is a type of positive displacement flow meter that measures the volumetric flow rate of a liquid by using two meshing gears to trap and count fixed volumes of fluid. As the fluid flows, it causes the gears to rotate, and a non-contact sensor detects these rotations. By counting the number of rotations per unit of time, the flow rate can be accurately determined. These meters are known for their high precision, repeatability, and ability to measure viscous and challenging media.
