Gearbox lubrication system is a critical component of any mechanical system that uses gears. The primary purpose of the gearbox lubrication system is to ensure that the gears are properly lubricated, reducing friction and wear between the gear teeth. Proper lubrication also helps to dissipate heat generated by the gears, preventing overheating that can cause damage to the gearbox. There are several types of gearbox lubrication systems, including splash lubrication, forced lubrication, and spray lubrication. In splash lubrication, oil is splashed onto the gears, allowing it to flow into the gear teeth and lubricate them. Forced lubrication, on the other hand, uses a pump to circulate oil through the gearbox, ensuring that it reaches all parts of the gearbox. Spray lubrication

is used in high-speed gearboxes and involves atomizing oil and spraying it onto the gears.
