The global Gel Documentation Systems market size is predicted to grow from US\$ 331 million in 2025 to US\$ 486 million in 2032; it is expected to grow at a CAGR of 5.7% from 2026 to 2032.

Gel documentation systems are laboratory instruments used to detect and analyze the distribution of biomolecules after gel electrophoresis. They primarily combine optical imaging, laser scanning, or fluorescence detection technologies to convert signals from samples on the gel into visual images, enabling qualitative and quantitative analysis of proteins, nucleic acids, or other biomolecules. These systems typically include light sources, filters, cameras or scanners, and image acquisition and processing software, capable of capturing sample signals under UV, visible, or fluorescence channels. Gel documentation systems offer high sensitivity, good reproducibility, and ease of operation, and are widely used in molecular biology, proteomics, genomics, and drug development for visualizing and quantifying protein, DNA, or RNA bands and recording experimental data. Modern gel documentation systems also feature automated analysis functions, such as band recognition, density measurement, and report generation, enhancing experimental efficiency and data reliability.
