According to our LPI (LP Information) latest study, the global Gel Electrophoresis market size was valued at US$ 1249.7 million in 2023. With growing demand in downstream market, the Gel Electrophoresis is forecast to a readjusted size of US$ 1790.4 million by 2030 with a CAGR of 5.3% during review period.

The research report highlights the growth potential of the global Gel Electrophoresis market. Gel Electrophoresis are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Gel Electrophoresis. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Gel Electrophoresis market.

Gel electrophoresis is a method for separation and analysis of macromolecules (DNA, RNA and proteins) and their fragments, based on their size and charge. It is used in clinical chemistry to separate proteins by charge and/or size (IEF agarose, essentially size independent) and in biochemistry and molecular biology to separate a mixed population of DNA and RNA fragments by length, to estimate the size of DNA and RNA fragments or to separate proteins by charge.

Personalized medicine is an umbrella term used for treatments tailor-made to suit individual patients' anatomy and morphology. Personalized medicines greatly increase the efficacy of treatments through companion diagnostics and genetic testing. These drugs minimize any adverse effects the treatment may have on the patient. Gel electrophoresis techniques are widely adopted in the field of personal medicine to accurately map and analyze the abnormal tissues or molecules responsible for causing
