Gel filtration filler is a porous material used for chromatographic separation, commonly used in gel filtration (also known as molecular sieve) chromatography, to separate molecules according to their size. It is made of polymers or polysaccharide-based materials (such as dextran, polyacrylamide or silica gel) with a certain pore size. Substances with smaller molecules can enter the pores and delay their outflow, while larger molecules are excluded and flow out preferentially, thereby achieving molecular weight separation. It is widely used in protein purification, peptide analysis and research on biomacromolecules.
