Abstracts

The global Gelatin-Based Bioink market size is predicted to grow from US$ 121 million in 2025 to US$ 461 million in 2032; it is expected to grow at a CAGR of 21.5% from 2026 to 2032.

Gelatin-based bioink refers to a class of hydrogel biomaterials derived from gelatin (a denatured form of collagen) and often chemically modified (for example methacrylation to form GelMA) so that it can support 3D bioprinting of living cells and tissues by providing an extracellular-matrix-like, cell-friendly environment.

In the industry chain, upstream inputs include raw materials such as animal- or marine-derived collagen/gelatin, chemical reagents for modification (e.g., methacrylic anhydride), photoinitiators, sterile cell culture media, and manufacturing infrastructure (cleanrooms, formulation equipment, lyophilisation). Midstream is the bioink production: formulation of gelatin/modified gelatin hydrogel, sterilisation, packaging into vials or cartridges, quality control (sterility, endotoxin levels, viscosity, rheology). Downstream applications include 3D bioprinting for tissue engineering, organ-on-chip models, drug screening, regenerative medicine implants and contract research organisation (CRO) services.

In 2024, global Gelatin-based bioink sales volume reached approximately 0.78 million units, with an average global market price of around 130.5 US$ per unit.

United States market for Gelatin-Based Bioink is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Gelatin-Based Bioink is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
