Gemcitabine is used in combination with carboplatin to treat ovarian cancer (cancer that begins in the female reproductive organs where eggs are formed) that returned at least 6 months after finishing a previous treatment. It also used in combination with paclitaxel (Abraxane, Taxol) to treat breast cancer that has not improved or that has worsened after treatment with other medications. Gemcitabine is used in combination with cisplatin to treat a type of lung cancer (non-small cell lung cancer; NSCLC) that has spread to other parts of the body and cannot be treated with surgery. Gemcitabine is also used to treat pancreatic cancer that has spread to other parts of the body and has not improved or worsened after treatment with another medication. Gemcitabine is in a class of medications called antimetabolites. It works by slowing or stopping the growth of cancer cells in the body.
