The global Gene Breakage Probe Reagent market size is predicted to grow from US\$ 25.19 million in 2025 to US\$ 42.43 million in 2032; it is expected to grow at a CAGR of 7.9% from 2026 to 2032.

Gene break probe reagent is a reagent used to detect gene breakage, which is mainly based on fluorescence in situ hybridization (FISH) technology. Gene break probe reagents complementarily bind to target sequences in cells through specific DNA sequences to form a hybrid of target gene and nucleic acid probe. These probes are usually fluorescently labeled, so that the presence of hybrids can be observed under a fluorescence microscope, thereby determining whether the target gene is broken.
