Gene synthesis refers to chemically synthesizing a strand of DNA base-by-base. Unlike DNA replication that occurs in cells or by Polymerase Chain Reaction (PCR), gene synthesis does not require a template strand. Rather, gene synthesis involves the step-wise addition of nucleotides to a single-stranded molecule, which then serves as a template for creation of a complementary strand. Gene synthesis is the fundamental technology upon which the field of synthetic biology has been built.

The global Gene Synthesis market size is projected to grow from US\$ 655 million in 2024 to US\$ 1676 million in 2030; it is expected to grow at a CAGR of 17.0% from 2024 to 2030.
