According to this study, the global General Engineering Plastics market size will reach US\$ 106420 million by 2031.

Engineering plastics are types of plastics that will have better chemical resistance, impact and mechanical strength than commodity plastics. They will perform better under extreme stress and heat.

Engineering plastics are a class of polymers that have been specially formulated to exhibit enhanced mechanical, electrical, thermal, and chemical properties compared to commodity plastics. These enhanced properties allow engineering plastics to be used in demanding industrial and engineering applications such as gears, bearings, bushings, and medical implants.

The main difference between engineering plastics and commodity plastics is that engineering plastics are used in more technically demanding environments. While commodity plastics are also popular, they are not suitable for the same applications as engineering plastics as they do not exhibit the same degree of material properties. Engineering plastic parts are typically manufactured by plastic injection molding or plastic extrusion, although 3D printing is also possible.

Engineering plastics play a pivotal role in many industries, such as: automotive, aerospace, electronics, medical, and consumer goods manufacturing. Engineering plastics are known for their ability to be used in applications where metals may be too heavy, expensive, or susceptible to corrosion, and where commodity plastics lack the strength and durability required. They are durable and versatile owing to their mechanical strength and impact resistance, coupled with their desirable thermal,

electrical, and chemical properties. Engineering plastics offer manufacturers an ideal balance between strength, cost, weight, and durability.

This report studies the General Engineering Plastics, include PMMI, PEI, PAI, PEEK, PEKK, PSU, PES, PPSU, PPS, PTFE, PCTFE, PVDF, and Others.
