General Lithium Titanate is a lithium battery anode material based on spinel lithium titanate, known for excellent safety, fast charge capability, and long cycle life. It operates at a higher anode potential than graphite, reducing risk of lithium plating and improving thermal stability. It is used in applications that require high power, frequent charge-discharge cycles, and wide temperature tolerance, such as buses, industrial vehicles, grid storage, and backup power. Performance depends on particle size control, surface modification, and electrode formulation compatibility.

The industrial chain includes upstream titanium sources, lithium salts, and auxiliary reagents, plus energy and processing utilities. Midstream processing involves calcination, milling, classification, surface coating, and quality control for purity and particle distribution. Downstream demand comes from battery cell manufacturers, integrators of energy storage systems, and vehicle power applications. Supporting services include electrochemical testing, material certification, and supply chain

traceability.
