## Abstracts

The global Generative Biology Intelligent Manufacturing Platform market size is predicted to grow from US\$ 4903 million in 2025 to US\$ 11161 million in 2032; it is expected to grow at a CAGR of 12.6% from 2026 to 2032.

The Generative Biology Intelligent Manufacturing Platform is a comprehensive platform that uses synthetic biology and generative design technologies, combined with automation, high-throughput screening and artificial intelligence, to design, create and optimize biological systems and biological products. Through this platform, a variety of products such as drugs, chemicals, materials, food ingredients and energy can be efficiently developed and produced, achieving innovation and sustainable development in various industries.

The industrial chain of the generative biology intelligent manufacturing platform can be divided into three major segments: upstream 'biological and digital foundation', midstream 'platform-based intelligent manufacturing capabilities', and downstream 'application and commercialization'. The upstream includes gene sequencing/synthesis, cell lines and chassis biology, reagents and consumables, automated experimental equipment, as well as computing infrastructure and AI algorithm tools, providing data, biomaterials and computing power for the platform. The midstream is the core generative biology intelligent manufacturing platform, which integrates generative AI models, digital twin biological systems, automated DBTL (design-build-test-learn) closed loop and cloud-based laboratories to achieve rapid design and optimization of molecules, strains and biological processes. It is the segment with the highest technical barriers and added value in the industrial chain. The downstream targets application scenarios such as pharmaceutical R&D and CDMO, bio-based materials, industrial

enzymes and synthetic biochemicals, agricultural biotechnology and food and flavorings, and realizes monetization through technology licensing, joint development, product revenue sharing or large-scale production. In terms of gross profit margin, upstream reagents, consumables and equipment typically have a margin of 30%–55%, while computing power and software tools have a margin of about 60%–80%. Midstream generative biological intelligent manufacturing platforms, which are centered on software, algorithms and data, generally have a gross profit margin of 65%–85%. Downstream applications vary greatly due to differences in product attributes, with pharmaceuticals and high-end biomaterials reaching 60%–75%, while bulk biochemicals and enzyme preparations are mostly in the range of 30%–50%.

The Generative Biology Intelligent Manufacturing Platform integrates synthetic biology, generative design and artificial intelligence, and represents the cutting-edge technology of biomanufacturing. Through efficient design, optimization and production processes, it significantly accelerates the development and marketization of new products. This platform has shown great potential in the fields of medicine, agriculture, biomaterials, etc., promoting industrial innovation, promoting the sustainable use of resources, and providing new solutions to solve the environmental and resource challenges facing the world.
