## Abstracts

The global Genotyping Chip market size is predicted to grow from US$ 52.09 million in 2025 to US$ 80.21 million in 2032; it is expected to grow at a CAGR of 6.5% from 2026 to 2032.

Genotyping chips are DNA microarrays designed to rapidly analyze genetic variation across a genome, most commonly by detecting single nucleotide polymorphisms (SNPs). They consist of thousands to millions of probes fixed on a solid surface that can hybridize with DNA samples, allowing researchers to determine which genetic variants an individual or population carries. Widely used in medicine, agriculture, and animal breeding, genotyping chips enable high-throughput, cost-effective studies of genetic diversity, trait association, and marker-assisted selection. By providing dense, standardized datasets, they support applications ranging from disease risk prediction to precision crop and livestock breeding. The average chip price ranges from tens to hundreds of dollars, depending on density and type.

United States market for Genotyping Chip is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Genotyping Chip is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

Europe market for Genotyping Chip is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
