Geometric optical waveguide module is an optical display technology mainly used in augmented reality devices to realize the overlay display of virtual information. Its working principle is based on optical waveguide technology. It transmits optical signals losslessly through total reflection, and can present high-definition full-color images on the lens. It is thin, light, highly translucent, and has high light efficiency. With the continuous advancement of technology and the reduction of costs, geometric light waveguide modules are increasingly used in consumer-grade AR glasses. In the future, they are expected to replace mobile phones and physical screens to provide a richer virtual reality
