The global Geophone Detector market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The ground sound detector, also known as the seismic perimeter alarm detector, is a device used to detect seismic waves generated by ground intrusions (such as people walking, vehicles driving, etc.). The working principle of this detector is based on the propagation and identification technology of seismic waves. It can convert the detected seismic wave signals into electrical signals, and identify and analyze them through the processor to determine whether it is a real intrusion.
