The global Geothermal Drilling Fluid Additive market size is predicted to grow from US\$ 949 million in 2025 to US\$ 1620 million in 2032; it is expected to grow at a CAGR of 8.1% from 2026 to 2032.

Geothermal drilling fluid additives are chemical substances used to improve drilling fluid performance during geothermal drilling operations. These include mud viscosity modifiers, lost circulation materials, lubricants, suspending agents, and loss control agents. They help maintain wellbore stability, facilitate chip removal, reduce friction, and control fluid leakage. In 2024, geothermal drilling fluid additive sales are estimated to be approximately 500,000 tons, with an average unit price of approximately \$1,800 per ton. Single-line production capacity is approximately 5,000 tons per year. Upstream companies primarily include basic chemical and polymer manufacturers, and suppliers of mineral raw materials (such as bentonite and barite). Downstream companies primarily include geothermal power project contractors, drilling service companies, and geothermal equipment manufacturers.

With the increasing global demand for renewable energy, especially geothermal energy, and increasingly stringent environmental regulations, geothermal drilling fluid additives will develop towards high-temperature and high-pressure adaptability, biodegradability, and low-environmental-impact formulations. While the demand for green additives increases, cost control and supply chain stability will become key challenges. Raw material price fluctuations and the uneven geographical distribution of geothermal wells may also restrict the rapid expansion of the market.
