Geothermal probes, also known as ground source heat pumps or geothermal heat exchangers, are devices used to harness the stable temperature of the earth for heating and cooling purposes. These probes are typically installed vertically or horizontally in the ground and consist of pipes through which a heat-conducting fluid circulates. During winter, the fluid absorbs heat from the earth and transfers it to the building, while in summer, the process is reversed, with excess heat from the building being transferred back into the ground. This system is highly efficient and environmentally friendly, as it utilizes renewable geothermal energy, reducing reliance on fossil fuels and lowering greenhouse gas emissions.

The global Geothermal Probes market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
