Gastroesophageal reflux disease involves the backflow of stomach?s content to mouth through esophagus which gives a burning sensation behind breast bone. Gastroesophageal reflux disease is a common digestive disorder which affects the food pipe and lower esophageal sphincter by deteriorating its elasticity. Gastroesophageal reflux disease occurs due to lifestyle changes and irregular eating habits & over consumption of fatty foods, coffee, alcoholic beverages, citrus fruits and pepper. In Gastroesophageal reflux disease there is excessive production of acid which damages the stomach lining and ultimately cause ulcers. Gastroesophageal reflux disease includes other symptoms such as regurgitation and dysphagia. However, abnormal reflux may cause uncharacteristic symptoms such as coughing, sore throat, otitis media, chest pain and enamel erosion or other dental manifestations.

The overall market has been experiencing a downturn in terms of revenue in the past several years as the leading drugs for GERD treatment have lost their patent protection, with their market shares now largely consumed by over-the-counter (OTC) and generic medications. Although loss of exclusivity of high-grossing drugs have caused a market fall-off, the demand for acid reducing drugs due to the high prevalence and incidence levels of GERD will prove beneficial to the industry from a commercial standpoint. GERD is one of the commonly observed recurrent gastrointestinal disorders worldwide. The prevalence of acid reflux and related symptoms has increased across the globe by nearly 50% over the last decade. This disorder not only has major effects on the health
