The report requires updating with new data and is sent in 48 hours after order is placed.

Highly pure germanium powder is produced in the smallest possible average grain sizes for the production of pressed and bonded sputtering targets as well as for chemical deposition processes (CVD) and physical deposition processes (PVD), including thermal and electron beam evaporation (e-beam), low temperature organic evaporation, atomic layer deposition (ALD), organometallic and chemical vapor deposition (MOCVD). Powders are also suitable for all applications where large surface areas are desired, e.g. B. for water treatment as well as for fuel cell and solar applications. Nanoparticles also produce very high surface areas. Standard powder particle sizes average in the range of -325 mesh, -100 mesh, 10-50 microns, and submicrons (
