Gestational diabetes can be defined as a type of diabetes that affects pregnant women. It is usually a temporary condition which develops during pregnancy and subsides after the birth of the baby. However, there are possibilities that diabetes may return in the later stages of life as type II diabetes mellitus. It is the inability of insulin to absorb the sugars consumed as part of the meal. It may be caused due to insulin resistance in a woman's body because of increasing levels of placental hormones being produced to sustain the development of the fetus. This condition starts when the female body is not able to make and use required amounts of insulin needed in pregnancy, resulting in a build-up of sugar in the bloodstream causing hyperglycemia.
