Gesture recognition radar is a device that uses radar technology to detect and recognize gestures. It does this by sending microwave signals and detecting the reflection of these signals from the human hand or other parts of the body. This technology can capture and analyze hand movements and postures without contact, thereby realizing the function of gesture control devices or systems. Gesture recognition radar has broad application prospects in smart homes, virtual reality, automotive technology, and medical health. Its advantage is that it can operate stably in complex environments and is not affected by light and objects.

The global Gesture Recognition Radar market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
