Stools tests are performed to diagnose the GI tract disorders and aid in the detection of parasites infection, bleeding obstruction, and inflammation. Stools tests can further be utilized for diagnosis of colorectal cancer or presence of pathogens such as Rotavirus, C. difficile, H. pylori among others in the GI tract. Laboratory tests used for the stool testing are either microbial particle-based or antibody-based, which include chemiluminescence immunoassays (CLIA), immunoassay and molecular diagnostic testing.

Increased incidence of C. difficile infections and other gastrointestinal diseases increases the demand for stool tests, thereby driving the global GI stool testing market. According to the Centers for Disease Control and Prevention, in 2014, an estimated of

14.8 million adults were diagnosed with ulcers and other digestive disorders in the United States. Furthermore, in 2017, 135,430 new cases of colorectal cancer were diagnosed in the country, raising the demand for GI stool testing. However, the challenge of accurate testing restrains the market.
