The global Giant High-altitude Balloon market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The Giant High Altitude Balloon (GHAB) is a balloon designed to carry scientific instruments, telescopes, cameras and other payloads to the very high altitude of the Earth's atmosphere. GHAB is usually made of lightweight materials such as polyethylene and filled with helium to provide the lift required to transport the payload to high altitude. GHABs can reach an altitude of 40 kilometers (25 miles) above sea level, which is much higher than the altitude of most aircraft. At these altitudes, GHAB can provide a stable platform for scientific instruments to observe the Earth's atmosphere, the sun and other astronomical objects. GHAB is usually used in scientific research to study atmospheric phenomena, such as ozone depletion, climate change and cosmic rays. They are also used to study astronomical objects such as the sun, stars and galaxies. GHAB can provide low-cost satellite alternatives for some scientific applications, and can be used for shorter duration experiments that do not require long-term monitoring.
