## Abstracts

The global Giant Human Heart Model market size is predicted to grow from US\$ 517 million in 2025 to US\$ 734 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

In 2025, global Giant Human Heart Model production reached approximately 94,350 Units. The average price is approximately \$5,600. Giant Human Heart Model is a physical teaching model that is scaled up (usually 2 times, commonly 3-8 times) according to the anatomical structure of a real human heart. It is used to provide an intuitive, detachable, and tactile three-dimensional representation of the internal and external structures of the heart in teaching, training, or demonstration scenarios.

### Gross Profit Margin Levels

The gross profit margin for giant human heart models is generally not low, but the stratification is very pronounced. Low-end OEM export products are mostly made with PVC injection molding or basic spraying processes. Although the unit price is low, the unit material cost after mold amortization is not high, and the gross profit margin can usually still be maintained at around 20%-35%. In branded educational models, with the increase in the number of structural components, labeling systems, teaching materials, channel services, and after-sales guarantees, the gross profit margin generally increases to 35%-60%. High-end models like those from 3B, SOMSO, and Denoyer, which emphasize handcrafted production, proprietary materials, classroom demonstrations, and brand endorsement, can theoretically reach 55%-65% or even higher. The core reason for this difference is not the raw materials themselves, but rather the process, brand, channel markups, transportation costs, and end-user value. This differentiation can also be seen on public websites: at one end are OEM or low-

priced educational models costing tens of dollars, and at the other end are high-end demonstration-grade products costing hundreds to thousands of dollars, or even thousands of pounds.

## Industry Drivers

The growth of this market is primarily driven by the continued demand in medical and nursing education for visual, tactile, and multi-person simultaneous observation teaching aids. Despite the rapid development of digital anatomy and simulation software, enlarged cardiac models still offer significant efficiency advantages in classrooms, skills training, and patient interpretation scenarios, especially the value of a 'shared field of vision' in multi-person teaching. Secondly, the increased emphasis on patient education by hospitals and clinics has also driven demand for large cardiac models, as they are easier to explain issues such as valves, coronary arteries, bypass surgery, and heart failure than flat diagrams. Thirdly, exhibitions, public education, and brand communication scenarios require more visually impactful display props, thus ensuring a stable long-term demand for 8x or lecture-sized models. Finally, from a broader perspective, the overall medical simulation market is still expanding, indicating a continuous increase in investment in teaching and training. Giant cardiac models occupy a crossroads of 'low digital substitution and strong display and communication value,' and therefore will maintain stable growth in the low to mid-single digits.
