Gingival hemostatic retraction paste is a specialized dental material used primarily during various dental procedures to control bleeding and retract the gingiva, or gum tissue. When performing operations such as taking impressions for dental restorations, preparing cavities, or cementing crowns and bridges, it is crucial to have a clear and dry operating field. The hemostatic properties of the paste work by constricting blood vessels and promoting blood coagulation, effectively stopping any bleeding from the gingival sulcus. At the same time, its physical properties enable it to gently displace the gum tissue away from the tooth surface, creating a space that allows dentists to access the tooth structure more easily and obtain accurate impressions. Composed of various active ingredients like aluminum chloride or ferric chloride, these pastes come in different forms, including syringes for precise application and capsules for convenient storage and single - use. By providing hemostasis and gingival retraction, this paste significantly enhances the quality and success rate of dental procedures, ensuring better outcomes for patients.
