Geographic information system (Geographic Information System or Geo-Information system, GIS) is sometimes called 'geological information system'. It is a specific and very important spatial information system. It is a technical system that collects, stores, manages, calculates, analyzes, displays, and describes relevant geographical distribution data in the space of all or part of the earth's surface (including the atmosphere), supported by computer hardware and software systems.

Location and geographic information are both the core and foundation of LBS. A simple latitude and longitude coordinate can only be recognized and understood by users after it is placed in specific geographic information, represented by a certain place, sign, and bearing. After users obtain location information through related technologies, they also need to understand the geographical environment they are in, and query and analyze environmental information to provide information support and services for user activities.
