The global Glass Fiber for Wind Power and Photovoltaic market size is predicted to grow from US\$ 1287 million in 2025 to US\$ 1783 million in 2032; it is expected to grow at a CAGR of 4.9% from 2026 to 2032.

Glass fiber for wind power and photovoltaic refers to glass fiber products specially used in wind power and photovoltaic power generation equipment. These glass fibers often have specific performance requirements to meet the working environment and use needs of wind and photovoltaic equipment.

Glass fiber, an inorganic non-metallic material with excellent performance, is widely used in construction, transportation, electronics, and other fields. In the construction and building materials sector, domestic demand for building materials is generally weak due to the sluggish real estate market. In the transportation sector, the development of rail transit and new energy vehicles has provided new growth for glass fiber's application. In the electronics and electrical sector, national subsidies for consumer electronics, coupled with the growth of AI applications, have driven continued positive demand for electronic-grade glass fiber. Furthermore, the rapid development of the wind power and photovoltaic industries has provided broad space for the application of glass fiber in the energy and environmental protection sectors. Overall, despite a weakening of traditional demand, the growth of emerging demand and marginal improvements on the supply side provide strong support for the future development of the glass fiber industry. Blades are the most fundamental and critical components of wind turbines, playing a vital role in their power generation efficiency and operational safety. Glass fiber, with its excellent strength and fatigue resistance, can improve blades' wind resistance, increase blade life, and reduce blade weight.

Glass fiber is primarily used as a reinforcement material in wind turbine blades. Blades are the most fundamental and critical components of wind turbines, playing a vital role in their power generation efficiency and operational safety. Glass fiber has excellent strength and fatigue resistance, improving blade wind resistance, increasing blade life, and reducing blade weight. According to data from the Wind Energy Professional Committee of the China Renewable Energy Society, my country's newly installed wind power capacity is expected to reach 105-115 million kilowatts by 2025, and its total installed wind power capacity is expected to reach 630.68 million kilowatts by 2025, a year-on-year increase of 21.1%. The global and Chinese glass fiber industries are highly concentrated, with a predominantly oligopolistic landscape. Since 2000, China's glass fiber industry has been experiencing rapid growth, with production scale continuously expanding. Currently, the global glass fiber industry has reached a high level of concentration, with a predominantly oligopolistic competitive landscape.
