## Abstracts

The global Glass Fiberboard market size is predicted to grow from US\$ 24410 million in 2025 to US\$ 37460 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

Glass Fiberboard are sheet materials made by impregnating treated fiberglass cloth with a resin solution (usually epoxy resin), followed by heat treatment (pre-baking) to bring the resin into the B-stage. These panels are then cut, layered, and pressed together to form a sheet-like product. Glass Fiberboard possess low weight, high mechanical and dielectric properties, good moisture resistance, heat resistance, chemical stability, and good processability. After being punched/CNC (planar) or thermoforming (3D), and decorated, they can be used to create mobile phone back covers, characterized by their lightness, thinness, and high strength, making them highly favored by mainstream terminal manufacturers. In 2024, global production of Glass Fiberboard reached 4.303 billion pieces, with an average selling price of \$5.46 per piece. Companies had an annual production capacity of 70 million pieces and a gross profit margin of 14.7%-28.4%. Upstream fiberglass material companies include: China Jushi, Owens Corning (OC), NEC Glass (NEG), Taishan Fiberglass, Chongqing International (CPIC), and JM (JM); downstream customers include Amazon, Microsoft, Google, Philips, Skyworth, Dell, Transsion, Huawei, Honor, Xiaomi, ZTE, OPPO, and vivo.

Glass Fiberboard offer several advantages as an exterior material for smart terminal products. They are low in density, high in strength, resistant to deformation, and provide excellent drop resistance, eliminating the need for a protective case. Furthermore, fiberglass and its fabrics are commonly used and cost-effective. In the design of smart device casings, fiberglass provides advantages such as lightness, thinness, rigidity, ease of shaping, and a low dielectric constant, enabling thinner and lighter designs compared to composite materials and glass covers.
