The global Glass Ionomer Cement for Dental market size is predicted to grow from US$ 269 million in 2025 to US$ 335 million in 2032; it is expected to grow at a CAGR of 3.2% from 2026 to 2032.

Glass ionomer cement for Dental is a water-based dental restorative and luting material formed by an acid–base reaction between a fluoroaluminosilicate glass powder and an aqueous solution of polyalkenoic acids, most commonly polyacrylic acid or its copolymers. When mixed, the polyacid attacks the glass surface, releasing calcium, aluminum, fluoride and other ions, which crosslink the polymer chains and create a rigid polysalt matrix that embeds the remaining glass particles. This setting mechanism gives glass ionomer cement its characteristic combination of properties: chemical adhesion to enamel and dentin via ionic interaction with calcium in the tooth structure, sustained fluoride release and partial recharge, and a coefficient of thermal expansion relatively close to that of natural teeth. Clinically, conventional glass ionomer cements are used as luting agents for crowns, bridges and orthodontic bands, as restorative materials for non-stress-bearing areas (such as cervical lesions and primary teeth), as liners and bases under other restorations, and as materials for atraumatic restorative treatment in pediatric and community dentistry. Their inherent radiopacity facilitates radiographic evaluation, while their hydrophilic nature allows better tolerance of slight moisture compared with purely hydrophobic resin systems.
