## Abstracts

The global Glass Long Fiber Reinforced Polymer market size is predicted to grow from US\$ 491 million in 2025 to US\$ 695 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

Glass Long Fiber Reinforced Polymers are composite materials made by combining long glass fibers with polymers (such as plastics) to improve the polymer's strength, stiffness, and heat resistance. The main raw materials for GFRPs are long glass fibers and polymer resins. With their advantages of being lightweight, high-strength, corrosion-resistant, and having good insulation properties, they are gradually replacing metallic materials and are used in various fields such as automotive, rail transportation, and aerospace. Global sales in 2024 were approximately 150,000 tons, with an average market price of approximately US\$3,200 per ton. The scale of single-line production capacity varies depending on the production process and investment scale. The industry's gross profit margin ranges from 18% to 35%.

The demand for lightweighting in the automotive industry is a core driving force, especially in the field of new energy vehicles. LFT is used to manufacture components such as front-end modules, battery pack housings, seat frames, and engine hoods. Its high strength and impact resistance meet stringent safety requirements and can effectively reduce weight. Excellent overall performance is another major driving force. Compared with short fiber varieties, LFT can provide higher rigidity, impact strength, creep resistance, and dimensional stability.
