Anodic bonding glass substrate is a glass substrate used for anodic bonding. Anodic bonding is a technology that combines a glass substrate with other conductive material substrates (such as metal or semiconductor), and is particularly suitable for bonding glass to metal or semiconductor substrates. This process involves applying an external voltage between the two substrates and keeping the substrates in a temperature range compatible with microelectronics processing. During the anodic bonding process, the electrostatic force generated by the bonding voltage is the driving force that brings the two substrates into close contact and is a necessary condition for the bonding reaction to occur.
