The global Glass-to-metal Electrical Feedthroughs market size is predicted to grow from US$ 1084 million in 2025 to US$ 1535 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

Glass-to-metal electrical feedthroughs are specialized components used to establish a sealed electrical connection between a vacuum or pressurized environment and the external circuitry while maintaining an impermeable barrier to gases or fluids. These feedthroughs consist of a metal conductor that is sealed within a glass insulator, typically made from materials like borosilicate or aluminosilicate glass, which provides electrical insulation. The metal portion of the feedthrough is usually made from materials like stainless steel or alloy, chosen for their compatibility with the glass and ability to handle high temperatures or corrosive environments. Glass-to-metal feedthroughs are widely used in industries such as aerospace, medical devices, high-energy physics, and electronics, where reliable, high-performance, and secure electrical connections are required in harsh or controlled environments, such as vacuum chambers, pressure vessels, or high-temperature systems. The glass-to-metal seal ensures the feedthrough's durability and prevents contamination or leakage, making it a crucial component in many advanced technological applications.

United States market for Glass-to-metal Electrical Feedthroughs is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
