GLP-1 is a polypeptide hormone secreted by the intestine after being stimulated by food. It can stimulate the pancreatic beta cells to secrete insulin and participate in the regulation of blood sugar balance in the human body. However, natural GLP-1 is easily degraded by dipeptidyl peptidase in vivo and loses its activity. In order to make GLP-1 better for clinical application, drug developers have modified its structure and developed a series of GLP-1 receptor agonists. GLP-1 receptor agonists can exert the same biological effects as natural GLP-1, and can also avoid being degraded and inactivated, thereby prolonging the action time.
