The global GMP Grade High Salt-Active Universal Nuclease market size is predicted to grow from US\$ 10.01 million in 2025 to US\$ 58.14 million in 2032; it is expected to grow at a CAGR of 28.3% from 2026 to 2032.

In 2025, global GMP Grade High Salt-Active Universal Nuclease production reached approximately 12.42 K MU, with an average global market price of around 824 USD per MU.

GMP Grade High Salt-Active Universal Nuclease refers to a GMP-grade, recombinant, non-specific endonuclease designed for efficient degradation of a broad range of nucleic acids under high-salt bioprocessing conditions. Compared with conventional nucleases, this type of enzyme retains strong activity in elevated-salt process streams, making it suitable for host-cell nucleic acid removal, lysate viscosity reduction, chromatin degradation and downstream purification support in viral vector, vaccine, recombinant protein and other biologics manufacturing.

The core value of GMP Grade High Salt-Active Universal Nuclease lies in its ability to maintain strong nucleic acid degradation performance under medium- to high-salt bioprocessing conditions, addressing the limitation of conventional nucleases whose activity may decline in high-salt environments. In the manufacturing of AAV, lentiviral vectors, adenoviral vectors, vaccines and recombinant proteins, residual host-cell DNA/RNA, high lysate viscosity and heavy downstream purification burden remain major process challenges. By directly degrading residual nucleic acids in salt-containing process streams, SAN can reduce the need for additional desalting, buffer exchange or process redesign, helping manufacturers improve purification efficiency, simplify workflows and strengthen consistency in GMP production.

As cell and gene therapy, viral vector manufacturing, vaccines and next-generation biologics move further toward scale-up, regulatory compliance and commercial production, demand is increasing for GMP-grade process enzymes with robust quality systems, batch-to-batch consistency, regulatory documentation and broad process compatibility. Compared with research-grade nucleases, GMP Grade SAN is not merely an enzyme reagent, but a critical biomanufacturing tool that supports process efficiency, impurity control and regulatory readiness. Looking ahead, as high-salt purification strategies become more widely adopted in AAV and related biologics workflows, and as CDMOs and biopharma companies place greater emphasis on residual nucleic acid control, GMP Grade Salt-Active Nuclease is well positioned to become an important enabling material in advanced biomanufacturing.

The upstream raw materials for GMP Grade High Salt-Active Universal Nuclease mainly include recombinant expression systems, microbial fermentation media, GMP-grade buffer salts and stabilizers, chromatography packing materials, filtration/ultrafiltration consumables, quality control reagents, and pharmaceutical packaging materials. Representative suppliers include Thermo Fisher Scientific, Merck KGaA/MilliporeSigma, Avantor, Cytiva, Sartorius, Repligen, Kerry, BD Difco, Organotechnie/Solabia, SCHOTT Pharma, Stevanato Group, and West Pharmaceutical. Downstream applications are primarily in recombinant proteins, viral vaccines, and viral vectors. Typical customers include Thermo Fisher, Lonza, Oxford Biomedica, Sanofi, GSK, Merck, Pfizer, AstraZeneca, SK Bioscience, Sinopharm Group, and Sinovac Biotech, among others.

GMP Grade High Salt-Active Universal Nuclease varies greatly depending on product type, process path, and degree of automation, with industry gross margins typically ranging from 70% to 80%.
