The global GNSS Aided Inertial Navigation System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

GNSS aided inertial navigation system (GAINS) is a navigation system that combines Global Navigation Satellite System (GNSS) technology with inertial navigation. It uses signals from multiple satellite constellations, such as GPS, GLONASS, and Galileo, along with data from inertial sensors, such as accelerometers and gyroscopes, to determine the position, velocity, and attitude of a moving object. The GNSS aids the inertial sensors in providing accurate and reliable navigation information, especially in environments where there may be limited or blocked satellite signals. GAINS is commonly used in aerospace, marine, and land-based applications that require precise positioning and navigation in real-time.
