Gold electrode crystal oscillator is a key component used in electronic equipment, which usually consists of quartz crystal and metal electrodes. The main function of the crystal oscillator is to generate a stable electrical signal, which is often used in clock circuits, counters, digital circuits and other occasions. The manufacturing process of gold electrode crystal oscillator generally includes the following steps: First, cut the high-

purity quartz crystal into the desired shape and size, and then deposit a layer of metal electrodes on the surface of the crystal, usually using aluminum or chromium, etc. . Next, through processes such as photolithography and etching, the shape and size of the electrodes are precisely defined on the crystal surface. Finally, the crystal oscillator is packaged in a metal or plastic case to protect the crystal oscillator and facilitate installation. Gold electrode crystal oscillator has the advantages of high stability, low power consumption, small size and high precision, so it has been widely used in electronic equipment.
