Gold nanospheres are nanoscale particles composed predominantly of gold atoms arranged in a spherical shape. These nanospheres typically have diameters ranging from a few to a few hundred nanometers. Gold nanospheres exhibit unique optical, electronic, and catalytic properties due to their small size and high surface area-to-volume ratio. Gold nanospheres find applications in various fields such as biomedicine, catalysis, sensing, and electronics. In biomedicine, they are used for drug delivery, imaging, and therapy due to their biocompatibility and ability to be functionalized with targeting ligands or therapeutic agents. In catalysis, they serve as effective catalysts in various chemical reactions due to their high surface area and unique electronic properties. Furthermore, gold nanospheres are used in sensors for detecting various analytes such as biomolecules, gases, and ions. In electronics, they are incorporated into devices for applications such as plasmonic sensing, photodetection, and optoelectronics. Overall, gold nanospheres are versatile nanomaterials with a wide range of applications, particularly in biomedical and catalytic fields, owing to their unique properties at the nanoscale.

The global Gold Nanosphere market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
