A GoTo telescope mount is an essential component of a GoTo telescope system. It is an electronically controlled device that holds and supports the telescope tube, enabling it to move and track celestial objects accurately. The mount is equipped with motors (usually stepper motors) that are controlled by a computer or an onboard controller. By inputting the observer's location, time, and the desired celestial object, the mount's control system calculates the object's position in the sky and commands the motors to move the telescope precisely to that location. Once positioned, the mount can continuously track the object as it moves across the sky due to the Earth's rotation, allowing for extended observation periods without the need for constant manual adjustment.
