## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

A GPS (or GNSS) simulator outputs exactly the same type of radio signal as emitted by the satellites themselves. The signals include all the information such as date and time that a GPS device would be able to convert if it was actually out in the real world.

When a receiver is connected to a simulator it behaves exactly as if it were really outside, moving around as per the scenario that is being played into it. A newly developed device can be benchmarked if it is repeatedly subjected to an identical strength and quality of signal rather than the dynamic and constantly changing live broadcast from GPS satellites.
