There is a significant difference between AI servers and traditional servers. AI servers are high-performance servers specially designed to perform computationally intensive tasks such as artificial intelligence, machine learning (ML), and deep learning (DL). It can learn how to run the server efficiently by collecting data, analyzing data, and simulating data. It can also adjust the performance of the server according to different applications and user requests to provide better server performance. Although traditional servers can also process large amounts of data, manual intervention is required to improve server performance. From a technical perspective, GPU cards account for 90% of the market share.

The global GPU-accelerated AI Servers market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
