The global GPU Servers market size is predicted to grow from US\$ 39130 million in 2025 to US\$ 111620 million in 2031; it is expected to grow at a CAGR of 19.1% from 2025 to 2031.

A GPU server is a dedicated server equipped with a high-performance graphics processing unit (GPU), which is usually used to perform graphics-intensive tasks, such as graphics rendering, deep learning, scientific computing, etc. The GPU takes the pressure off the system by retransmitting the compute-intensive parts of the application, making the application run significantly faster.

GPU servers are equipped with standard CPUs and GPUs. CPUs are usually only used for general computing, while GPUs are more used for AI, machine learning, and graphics rendering.

The CPU is the core component of the server. A server without a CPU cannot work. Therefore, GPU servers refer to servers that are more inclined to GPU application scenarios, such as video encoding and decoding, deep learning, scientific computing, etc.

GPU servers belong to a category of accelerated servers, which also include NPU, TPU, ASIC and FPGA. As artificial intelligence develops toward higher levels of human-like intelligence, its demand for computing power increases dramatically. Large artificial intelligence models need to deal with huge data sets and perform complex matrix and gradient operations. These tasks have extremely high standards for computing performance. With its excellent parallel computing capabilities, GPU servers can handle these highly intensive computing tasks quickly and efficiently, making them the

preferred platform for training and inference of large artificial intelligence models.

In terms of market competition, the core global GPU server companies are mainly Inspur, Dell, HPE, Huawei, etc., with the share of the top three companies exceeding 30%. The leading companies in the Chinese market are Inspur, H3C, Anqing, Ningchang, etc., among which the share of TOP3 companies exceeds 55%.

In terms of market drivers, the in-depth application of artificial intelligence in multiple industries has significantly promoted the rapid growth of demand for AI data centers. High-performance GPU accelerators, such as Nvidia's A100 and H100 series, rely on their excellent processing capabilities to demonstrate extraordinary strength in dealing with complex computing tasks, especially in the fields of machine learning and deep learning. In addition, GPU servers also play a key role in many fields such as scientific computing, data analysis and graphics rendering. They can greatly accelerate the training process of machine learning models. Thanks to the efficient concurrent computing capabilities of GPU servers, the training time of deep learning models can be significantly shortened.
