Starch graft copolymer is a new kind of macromolecular material. It takes hydrophilic and semi-rigid starch macromolecule as the skeleton, generates free radicals by physical and chemical methods, and copolymerizes with vinyl monomers. By introducing different functional groups and adjusting the proportion of hydrophilic and lipophilic segments, it has both polysaccharide compounds, intermolecular forces and reactivity, It also has the stability of mechanical and biological effects of synthetic polymers and the ability to unfold linear structures.

The global market for Graft Copolymerized Starches is estimated to increase from US\$ million in 2021 to reach US\$ million by 2028, exhibiting a CAGR of % during 2022-2028. Keeping in mind the uncertainties of COVID-19 and Russia-Ukraine War, we are continuously tracking and evaluating the direct as well as the indirect influence of the pandemic on different end use sectors.
