The global Grain Refining Master Alloy market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The grain refining master alloy is an alloy material used for grain refinement, which is added during metal casting and heat treatment to improve the mechanical properties and processing properties of metals by promoting grain refinement.

The grain refinement refers to reducing the grain size of a metal, usually to improve the strength, hardness and toughness of the material. Grain refining master alloys usually contain elements or compounds that can produce grain refining effects in the liquid or solid phase of the metal. By using the grain refined master alloy, a material with a fine grain structure can be obtained, thereby increasing the strength, toughness and wear resistance of the material, and improving the processing performance of the material.
