Crumb rubber is made by reducing scrap tires into small, uniform granules. Inherent reinforcing materials of scrap tires, such as steel and fiber, are removed, along with other types of inert contaminants such as dust, glass, and rock. Crumb rubber is used in various applications in rubber flooring, removable speed bumps, and athletic surfaces, including playgrounds, sports courts, and athletic turfs. Crumb rubber adds characteristics that improve the properties of finished products. It also helps lower costs by replacing more expensive virgin compounds. Two major technologies for producing crumb rubber are ambient mechanical grinding and cryogenic grinding. Of the two processes, cryogenic process is more expensive, but it produces smoother and smaller crumbs.
